

Bothered by your GUMMY SMILE? There are solutions available!

If your gums are exposed because the upper lip is lifted too high when you smile then a Gummy Smile Correction could be the solution. It is not always because you have small teeth that the gums are exposed. Sometimes your teeth just look small because when you smile there is an imbalance between the gums and upper lip.

Possible causes of a gummy smile are:

- Over-developed elevation muscle of the upper lip
- The upper lip and the gums are joined too closely
- Excess gum tissue

Available treatment options:

- Gum Correction
- Attaching facings or crowns to enlarge the tooth surface
- Detaching the upper lip
